Questions 1–5 comprise the tool for risk of bias assessment of case reports and case-series:

- 1. Did the patient(s) represent the whole case(s) of the medical center? (If the studies did not mention whether the reported patient(s) represented the whole case(s) of the medical center, we assumed that the authors have reported all the cases in their center giving the novel nature of Covid-19.)
- 2. Was the diagnosis correctly made?
- 3. Were other important diagnoses excluded?
- 4. Were all important data cited in the report?
- 5. Was the outcome correctly ascertained?
